

# Two Applications of Topological Methods for Neuronal Morphology Analysis

**Yusu Wang**

Computer Science and Engineering Dept.,  
The Ohio State University

*Joint work with*

*Suyi Wang, Yanjie Li (Ohio State University),*

*Partha Mitra (Cold Spring Harbor Laboratory)*

*Giorgio Ascoli (Krasnow Institute for Advanced Study at George Mason University)*

# Introduction

---

- ▶ Neurons essential to the functioning of life
- ▶ Neuronal morphology important in neuron functions
- ▶ Understanding 3D morphology of individual neurons
  - ▶ Reconstruction from 2D/3D images
  - ▶ Characterizing and comparing neuron structures

Based topological methods

# This Talk

---

Topological methods for:

- ▶ **Part I:**
  - ▶ Neuron structures comparison
- ▶ **Part II:**
  - ▶ Neuronal Morphology Reconstruction

# Neuronal structure 101

---

Can be considered as a tree structure with augmented information.

# Neuron Structures Comparison

---

- ▶ **Large number of neuroanatomical data publically available**
  - ▶ e.g, FlyCircuit.org, NeuroMorpho.org
- ▶ **Efficient algorithms to compare neuron structures**
  - ▶ E.g, to organize / classify large collection of neurons, to understand variability within a cell type, or to identify features

# Related Work

---

- ▶ **L-measure tool**
  - ▶ *[Scorcioni et al, 2008]*
- ▶ **Sholl-like analysis**
  - ▶ *[Sholl 1953]*
- ▶ **Arbor density representation**
  - ▶ *[Sümbül et al 2013]*
- ▶ **NBLAST**
  - ▶ *[Costa et al 2016]*

Our goal:

- Simple representation to facilitate efficient comparison,
- yet at the same time discriminative, capturing global tree structure

Develop a persistence-based feature-vectorization and comparison framework.

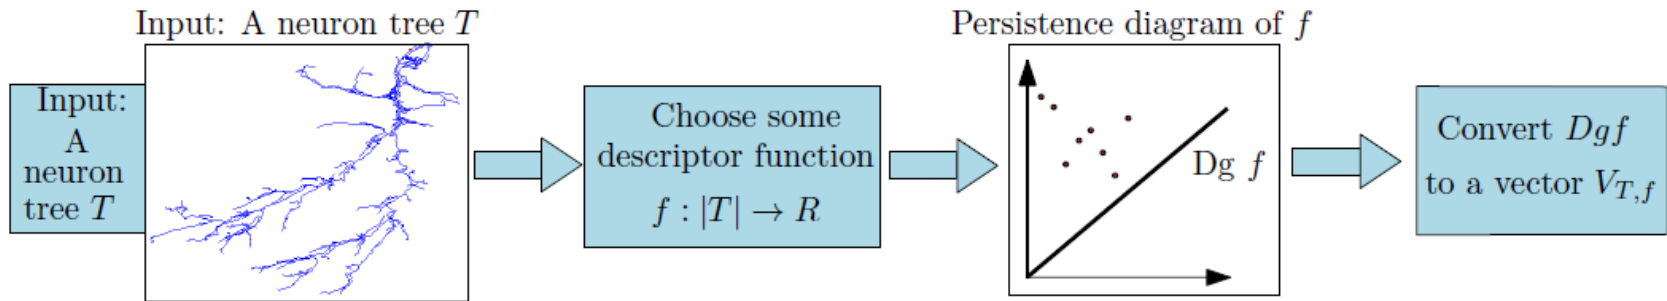

---

# Vectorization Framework

---

## ► Persistence-based feature vectorization framework

A similar persistence-based vectorization method was proposed independently in

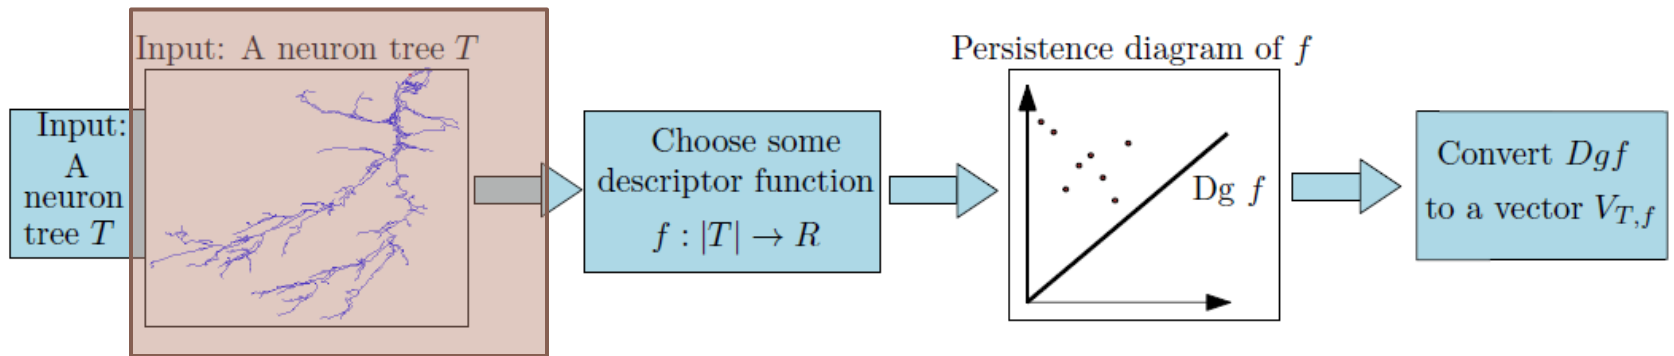

*[Kanari, Dlotko, Scolamiero, Levi, Shillcock, Hess, Markram, arXiv 2016]*

# Vectorization Framework

---

## ► Persistence-based feature vectorization framework

## ► Tree representation of neurons

- A set of tree nodes and arcs, where each arc is modeled by a polygonal curve.
- Often assume rooted tree with root  $r$  located at soma
- Tree nodes / arc may be associated with other information

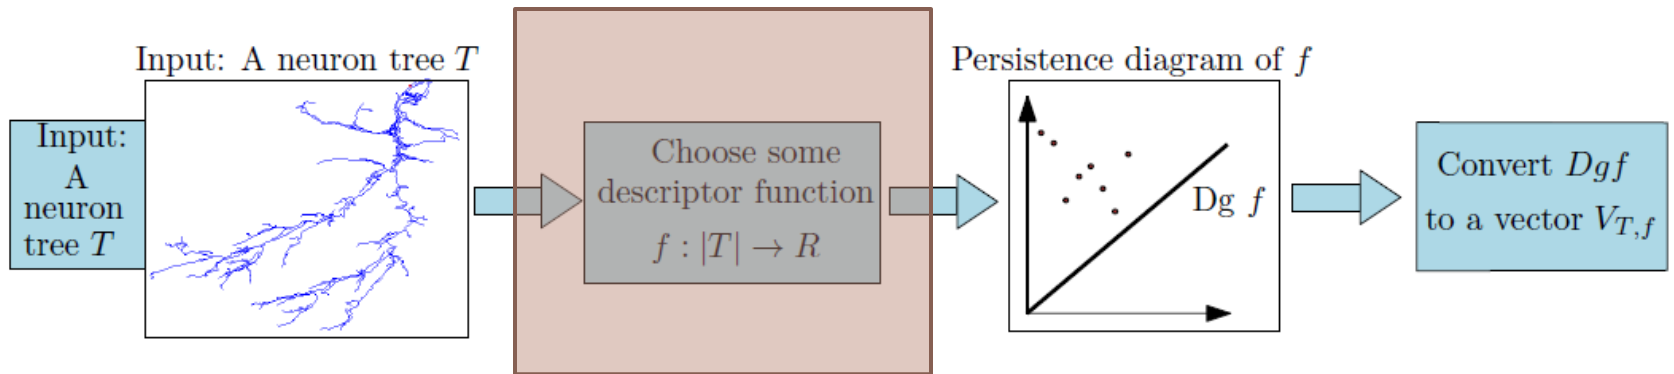

# Vectorization Framework

---

## ► Persistence-based feature vectorization framework

## ► Descriptor function(s) on $T: f: |T| \rightarrow R$

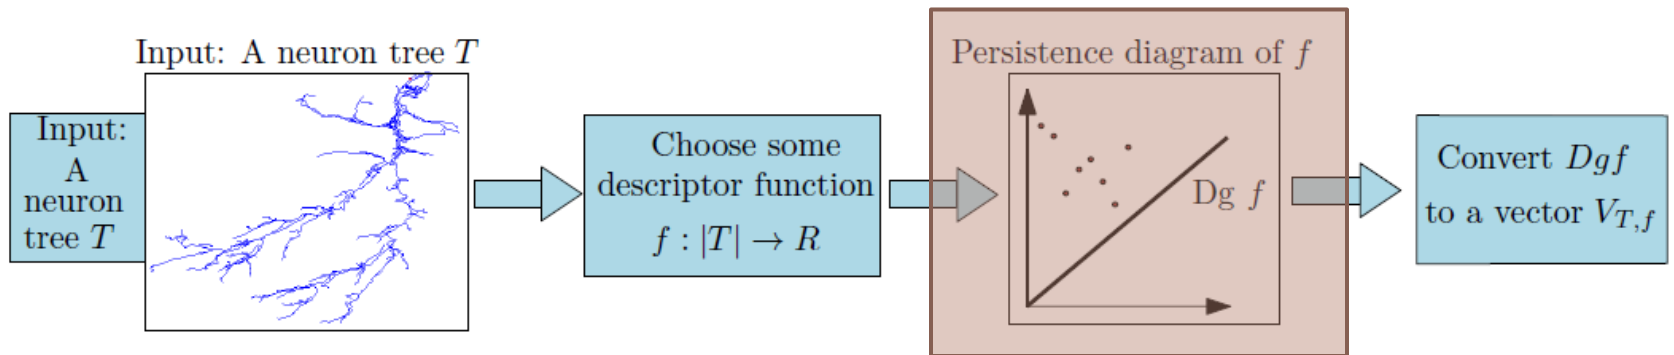

- Euclidean distance
  - For any  $x \in |T|$ ,  $f(x) = ||x - r||$
- Geodesic distance
- L-measure based and other morphological descriptors
- Electrophysiological measures

# Vectorization Framework

---

## ► Persistence-based feature vectorization framework

## ► Given descriptor function $f: |T| \rightarrow R$

- Compute the persistence diagram induced by the sub-level set and super-level set filtrations of  $f$  as its summary

# Persistent Homology 101

---

- ▶ *[Edelsbrunner, Letscher, Zomorodian 2000], [Zomorodian and Carlsson 2005],*  
Earlier developments: *[Frosini 1990], [Robins 1999]*
- ▶ Given a filtration of a space  $X$ 
  - ▶  $X_1 \subset X_2 \subset \dots \subset X_i \subset \dots \subset X_j \subset \dots \subset X_n = X$
  - ▶ Consider this as a lens through which we inspect  $X$
- ▶ Capture creation and death of “features” by homology
  - ▶  $H_*(X_1) \rightarrow \dots \rightarrow H_*(X_i) \rightarrow \dots \rightarrow H_*(X_j) \rightarrow \dots \rightarrow H_*(X_n) = H_*(X)$
  - ▶ Summarize the birth/death of homological features in the persistence diagram

# Distance Field Filtration Example

---

- ▶ A filtration induced by distance field.

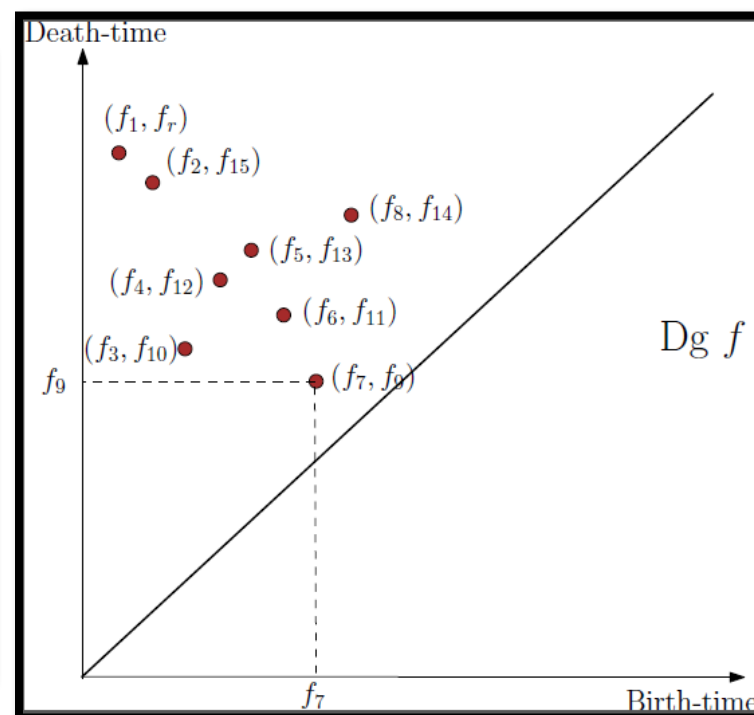

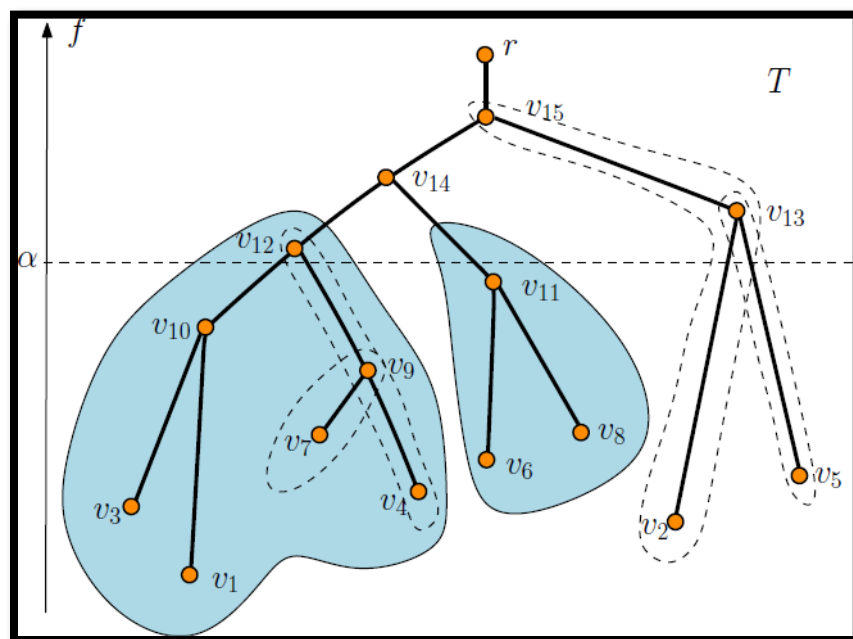

# In Neuron Setting

- ▶ Assume  $f$  is plotted as height function
- ▶ Filtration induced by the *sub-level set filtration*
  - ▶  $f^{-1}(-\infty, a_0) \subseteq f^{-1}(-\infty, a_1) \subseteq \dots \subseteq f^{-1}(-\infty, a_n) = T$

# In Neuron Setting

- ▶ Assume  $f$  is plotted as height function
- ▶ Filtration induced by the *sub-level set filtration*
  - ▶  $f^{-1}(-\infty, a_0) \subseteq f^{-1}(-\infty, a_1) \subseteq \dots \subseteq f^{-1}(-\infty, a_n) = T$

# Remarks

---

- ▶ Depending on the descriptor function  $f: |T| \rightarrow R$ , a tree may have both down-forks and up-forks.
  - ▶ Also consider *super-level sets filtration*, and its induced persistence diagram  $Dg_{-f}$
- ▶ Given a descriptor function  $f$ ,
  - ▶ Obtain persistence diagram summary  $Dgf = Dg_f \cup Dg_{-f}$
  - ▶  $Dgf$  serves as a summary of  $T$  from the perspective of descriptor function  $f$
- ▶ Persistence-summary intuitively more discriminative than simply statistics of morphological measures (eg. avg branching angles)

# Connection to Sholl-like Analysis

---

- ▶ Sholl function  $N: R^+ \rightarrow R^+$ 
  - ▶  $N(\lambda) :=$  number of intersection of  $T$  with a circle (sphere) centered at the root  $r$  with radius  $\lambda$

# Connection to Sholl-like Analysis

- ▶ Sholl function  $N: R^+ \rightarrow R^+$ 
  - ▶  $N(\lambda) :=$  number of intersection of  $T$  with a circle (sphere) centered at the root  $r$  with radius  $\lambda$
- ▶ One can recover full Sholl function from persistence diagrams induced by Euclidean distance function

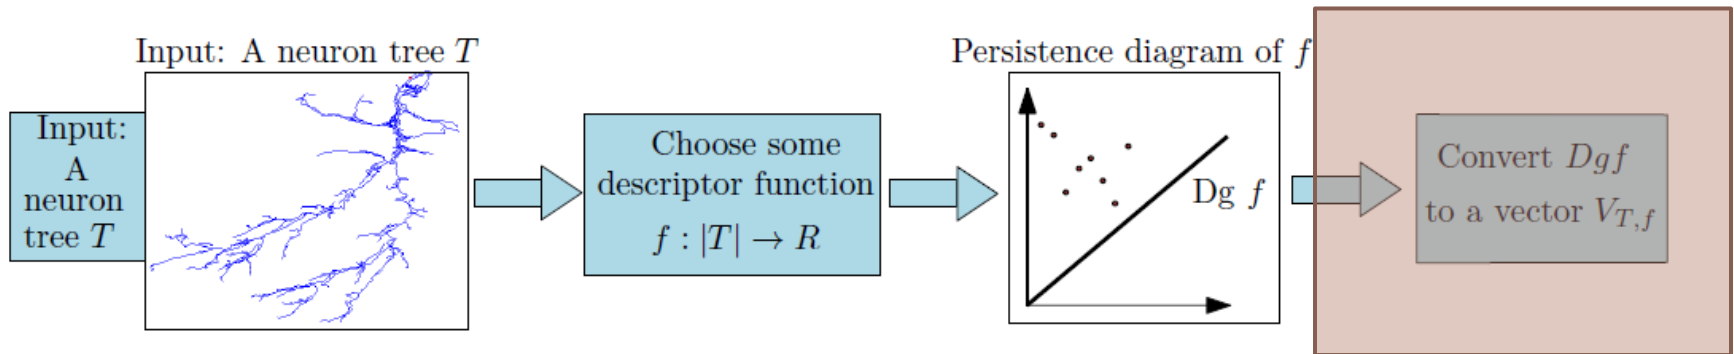

$N(r) =$  total number of points in these two regions

# Vectorization Framework

---

## ► Persistence-based feature vectorization framework

## ► To facilitate efficient distance computation

- Convert persistence diagram  $Dg f$  to a feature vector  $V_{T,f}$
- *[Bubenik 2012], [Reininghaus et al 2015], [Adams et al 2015],...*

# Feature Vectorization

- ▶ Convert diagram  $D$  to a 1D density field

- ▶  $\rho_D(x) := \sum_{i=1 \in k} m_i \cdot K_t(x, x_i)$ , for any  $x \in \mathbb{R}$ ,

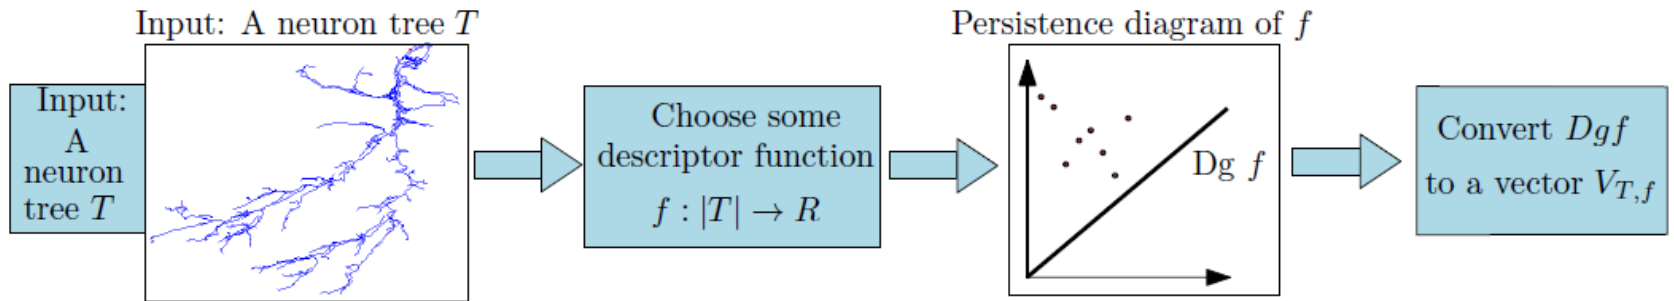

- ▶ Discretize it to a  $m$ -vector

- ▶  $\nu_D := [\rho_D(a + \frac{I}{m}), \rho_D(a + \frac{2I}{m}), \dots, \rho_D(a + \frac{mI}{m}) = \rho_D(b)]$ .

# Vectorization Framework

---

## ► Persistence-based feature vectorization framework

- If there are multiple descriptor functions
  - Concatenate their respective feature vectors
  - Perform dimensionality reduction to reduce dimension

# Remarks

---

- ▶ **Versatile framework**
  - ▶ Can combine multiple type of information of neurons, morphological or electrophysiological measures
  - ▶ Easy to add new measurements
- ▶ **Discreminative features**
  - ▶ E.g, persistence features from Euclidean function contains more information than Sholl function
  - ▶ E.g, persistence features from geodesic function encodes global morphological information
- ▶ **Have certain stability guarantees**

# Three Test Datasets

---

- ▶ Dataset 1:

- ▶ 379 neurons taken from neuromorpho.org category *Drosophila-Chklovskii*, manually categorized into 89 types
- ▶ *[Takemura et al, 2013]*

- ▶ Dataset 2:

- ▶ 127 neurons from four families: *Purkinje*, *olivocerebellar neurons*, *Spinal motoneurons* and *hippocampal interneurons*, downloaded also from neuronmorpho.org

- ▶ Dataset 3:

- ▶ 1268 neurons from Human Brain Project, downloaded from neuromorpho.org. Two primary cell classes: interneurons and principal cells, known for 1130 cells
- ▶ *[Markram et al 2015]*

# Preliminary Results

- ▶ Leave-one-out classification tests based on k-nearest neighbors

| # neurons for classified correctly out of 346 for all non-singleton classes Dataset 1 |                        |                   |                      |

# Preliminary Results

## ► Clustering for Dataset 2

(a)

(b)

# Preliminary Results

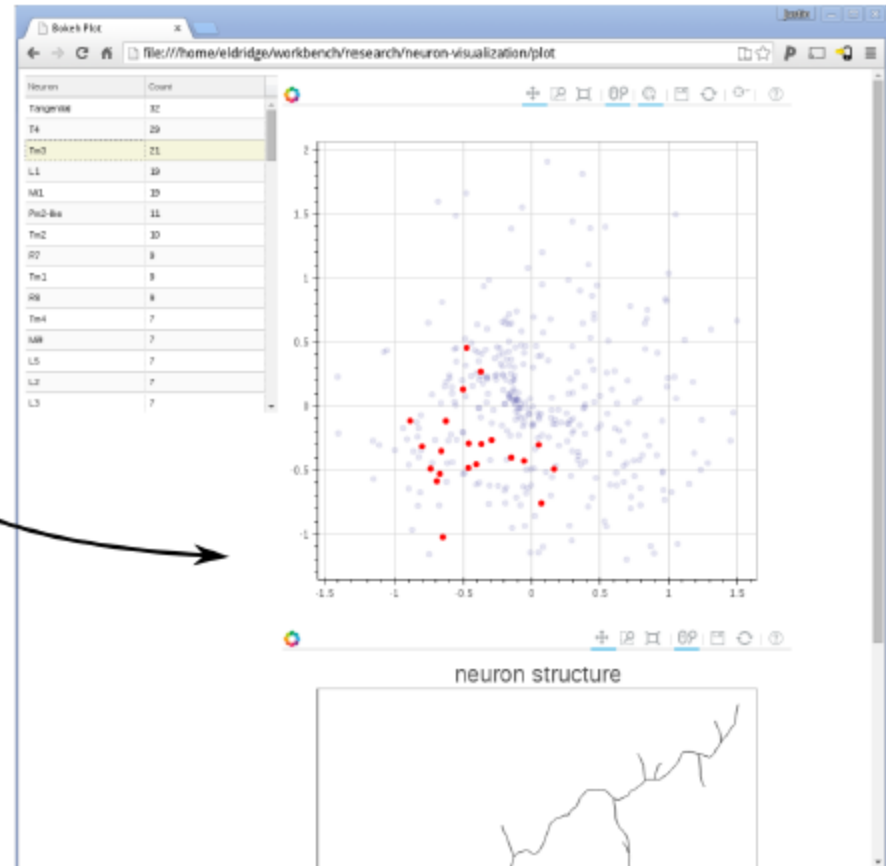

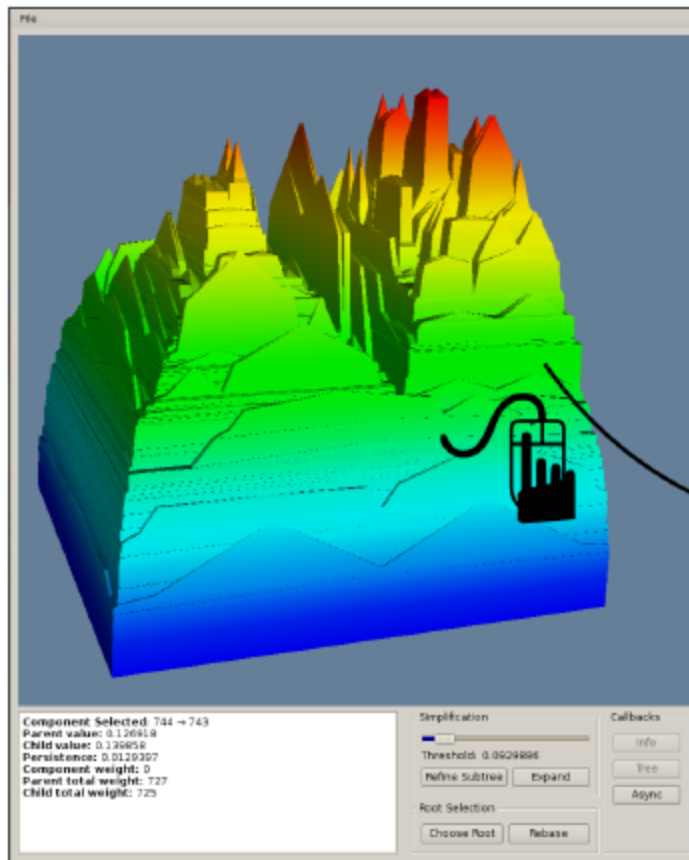

---

- ▶ Clustering for Dataset I
  - ▶ Five largest families other than “Tangential”

# Preliminary Results

## ► An interactive visualization tool

# This Talk

---

- ▶ Part I:

- ▶ Neuron structures comparison

- ▶ Part II:

- ▶ Neuronal Morphology Reconstruction

# Neuronal Morphology Reconstruction

---

- ▶ Various imaging techniques produce large number of 2D/3D images

Challenge:  
Automatic reconstruction of neuronal morphology from  
various imaging data.

# Related Work

---

- ▶ **DIADEM** challenge (2009—2010)
  - ▶ *Digital Reconstruction of Axonal and Dendritic Morphology*
  - ▶ <http://diademchallenge.org/>
- ▶ **BigNeuron** (launched in 2015)
  - ▶ Large-scale 3D single neuron reconstruction
  - ▶ Sponsored by 14 neuroscience-related research organizations and international research groups
  - ▶ <https://www.alleninstitute.org/bigneuron/about/>
- ▶ Many algorithms already integrated into platform **Vaa3D**
  - ▶ [*Peng et al., 2010*] [www.vaa3d.org](http://www.vaa3d.org).

# The Problem

---

- ▶ On the high level:
  - ▶ Given a 2D / 3D image data, the goal is to extract one (or multiple) tree-like structure(s) from it.
- ▶ Some challenges:
  - ▶ Various types of background ``noise``
  - ▶ Non-homogeneous distribution of signal in raw data
  - ▶ Mixture of multiple neurons

---

▶ **On the high level:**

- ▶ Given a 2D / 3D image data, the goal is to extract one (or multiple) tree-like structure(s) from it.

▶ **Previous methods:**

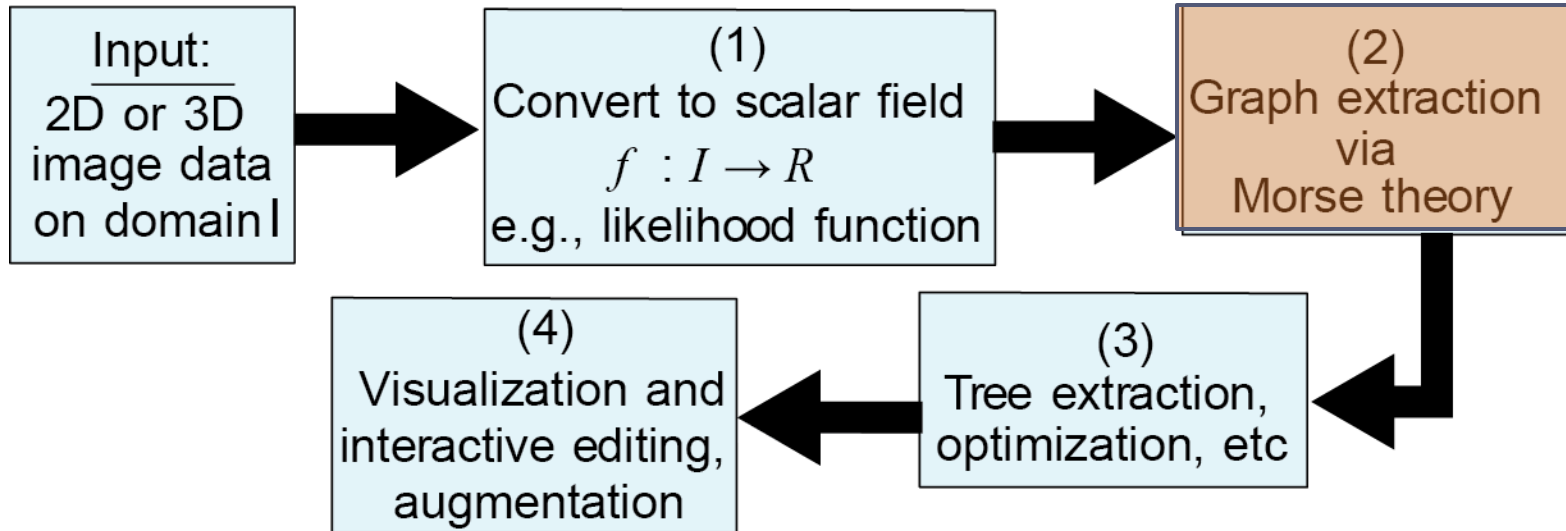

- ▶ Often rely on local information for decision making, sensitive to noise
- ▶ Some thresholding involved, challenging in handling non-uniform signal distribution
- ▶ Junction nodes identification challenging
  - ▶ E.g, ``growing'' individual branches and ``gluing'' them to obtain tree topology

# Morse-based Reconstruction Framework

---

## ► Morse-based approach

- uses global structure behind data
- junction nodes identification reliable w/o special processing
- robust against noise, small gaps, and non-uniformity in data
- conceptually clean, helps reducing pre-processing of data

# Main Idea

---

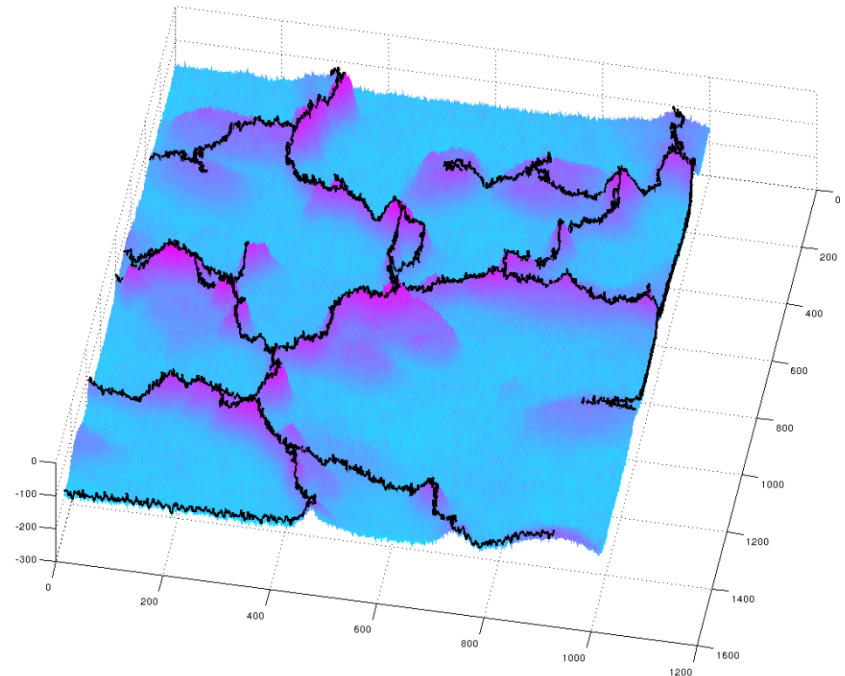

- ▶ Assume input is a scalar field
  - ▶  $f: I \rightarrow R$ , where high value of  $f$  indicates high signal value
- ▶ Consider graph  $f$  as a terrain (mountain range) on  $I \times R$ 
  - ▶  $I$  can be  $[0,1]^2 \subset R^2$  or  $[0,1]^3 \subset R^3$

# Main Idea

---

- ▶ Assume input is a scalar field
  - ▶  $f: I \rightarrow R$ , where high value of  $f$  indicates high signal value
- ▶ Consider graph  $f$  as a terrain (mountain range) on  $I \times R$ 
  - ▶  $I$  can be  $[0,1]^2 \subset R^2$  or  $[0,1]^3 \subset R^3$

# Main Idea

---

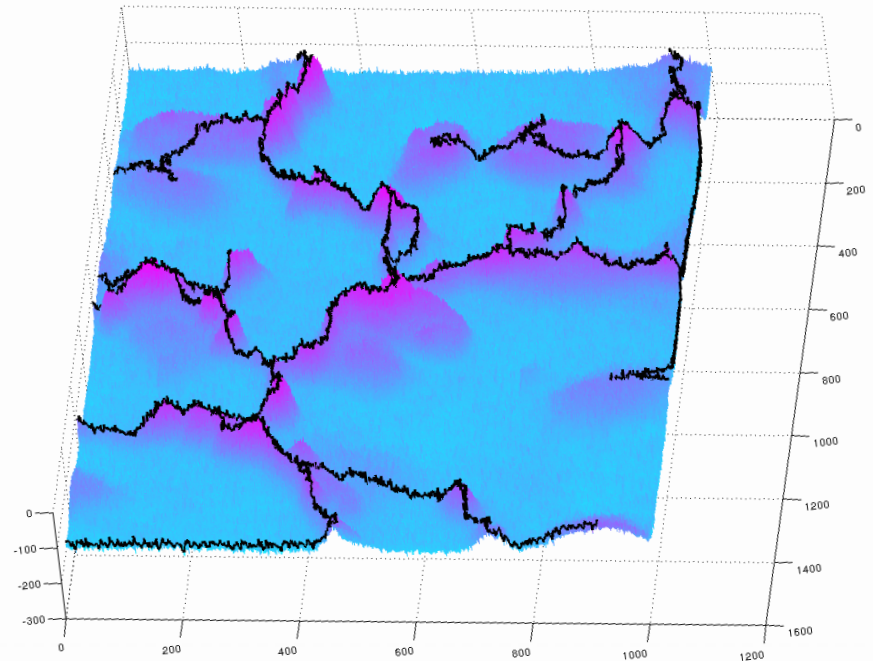

- ▶ Assume input is a scalar field
  - ▶  $f: I \rightarrow R$ , where high value of  $f$  indicates high signal value
- ▶ Consider graph  $f$  as a terrain (mountain range) on  $I \times R$ 
  - ▶  $I$  can be  $[0,1]^2 \subset R^2$  or  $[0,1]^3 \subset R^3$

# Main Idea

---

- ▶ Assume input is a scalar field
  - ▶  $f: I \rightarrow R$ , where high value of  $f$  indicates high signal value
- ▶ Consider graph  $f$  as a terrain (mountain range) on  $I \times R$ 
  - ▶  $I$  can be  $[0,1]^2 \subset R^2$  or  $[0,1]^3 \subset R^3$

# Main Idea

---

- ▶ Assume input is a scalar field
  - ▶  $f: I \rightarrow R$ , where high value of  $f$  indicates high signal value
- ▶ Consider graph  $f$  as a terrain (mountain range) on  $I \times R$ 
  - ▶  $I$  can be  $[0,1]^2 \subset R^2$  or  $[0,1]^3 \subset R^3$

The neuron structure ``tends to'' correspond to ridges of this terrain.

Use Morse theory to help identify ``mountain ridges''.

# Morse Theory: Smooth Case

---

- ▶ Let  $f: R^d \rightarrow R$  be a Morse function
- ▶ Gradient of  $f$  at  $x$ :  $\nabla f(x) = \left[ \frac{\partial f}{\partial x_1}, \frac{\partial f}{\partial x_2}, \dots, \frac{\partial f}{\partial x_d} \right]^T$

# Morse Theory: Smooth Case

---

- ▶ Let  $f: R^d \rightarrow R$  be a Morse function
- ▶ Gradient of  $f$  at  $x$ :  $\nabla f(x) = \left[ \frac{\partial f}{\partial x_1}, \frac{\partial f}{\partial x_2}, \dots, \frac{\partial f}{\partial x_d} \right]^T$
- ▶ Critical points of  $f$ :
  - ▶  $\{ x \in R^d \mid \nabla f(x) = 0 \}$

# Morse Theory: Smooth Case

---

- ▶ Let  $f: R^d \rightarrow R$  be a Morse function
- ▶ Gradient of  $f$  at  $x$ :  $\nabla f(x) = \left[ \frac{\partial f}{\partial x_1}, \frac{\partial f}{\partial x_2}, \dots, \frac{\partial f}{\partial x_d} \right]^T$
- ▶ Critical points of  $f$ :  $\{ x \in R^d \mid \nabla f(x) = 0 \}$
- ▶ An integral line  $L: (0, 1) \rightarrow R^d$ :
  - ▶ a maximal path in  $R^d$  whose tangent vectors agree with gradient of  $f$  at every point of the path

# Morse Theory: Smooth Case

---

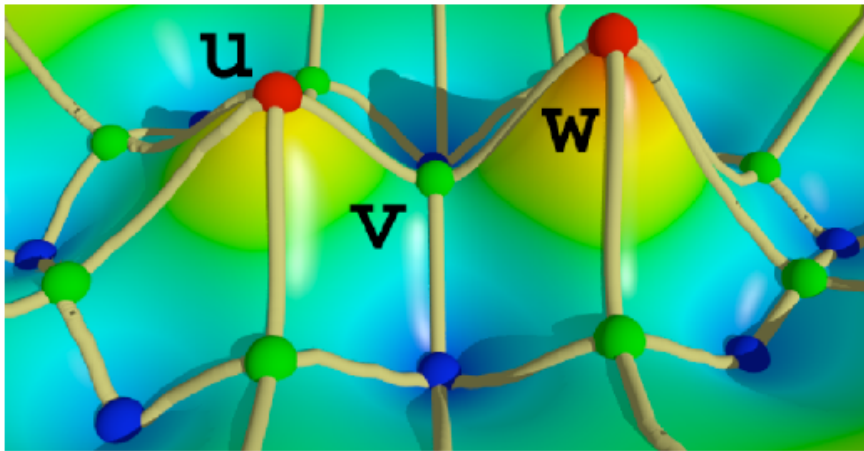

- ▶ Let  $f: R^d \rightarrow R$  be a Morse function
- ▶ Gradient of  $f$  at  $x$ :  $\nabla f(x) = \left[ \frac{\partial f}{\partial x_1}, \frac{\partial f}{\partial x_2}, \dots, \frac{\partial f}{\partial x_d} \right]^T$
- ▶ Critical points of  $f$ :  $\{ x \in R^d \mid \nabla f(x) = 0 \}$
- ▶ An integral line  $L: (0, 1) \rightarrow R^d$ :
  - ▶ a maximal path in  $R^d$  whose tangent vectors agree with gradient of  $f$  at every point of the path
  - ▶ has origin and destination at critical points
    - ▶  $Dest(L) = \lim_{p \rightarrow 1} L(p)$
    - ▶  $Ori(L) = \lim_{p \rightarrow 0} L(p)$

# Stable / Unstable Manifolds

---

- ▶ Given a critical point  $x$  of  $f$ 
  - ▶ Stable manifold  $S(x) = \{ y \in R^d \mid dest(y) = x \}$
  - ▶ Unstable manifold  $U(x) = \{ y \in R^d \mid ori(y) = x \}$
- ▶ Morse complex, Morse-Smale complex

# Stable / Unstable Manifolds

---

- ▶ Given a critical point  $x$  of  $f$ 
  - ▶ Stable manifold  $S(x) = \{ y \in R^d \mid dest(y) = x \}$
  - ▶ Unstable manifold  $U(x) = \{ y \in R^d \mid ori(y) = x \}$
- ▶ Morse complex, Morse-Smale complex

# Stable / Unstable Manifolds

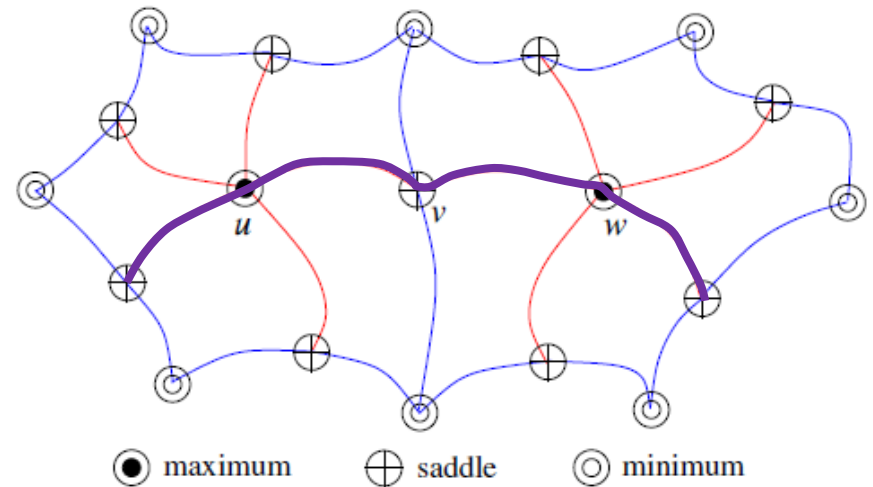

---

- ▶ Given a critical point  $x$  of  $f$ 
  - ▶ Stable manifold  $S(x) = \{ y \in R^d \mid dest(y) = x \}$
  - ▶ Unstable manifold  $U(x) = \{ y \in R^d \mid ori(y) = x \}$
- ▶ Morse complex, Morse-Smale complex

# Stable / Unstable Manifolds

- ▶ Given a critical point  $x$  of  $f$ 
  - ▶ Stable manifold  $S(x) = \{ y \in R^d \mid dest(y) = x \}$
  - ▶ Unstable manifold  $U(x) = \{ y \in R^d \mid ori(y) = x \}$
- ▶ Morse complex, Morse-Smale complex

1-unstable manifold (of index  $d - 1$  saddle points)  $\Rightarrow$  mountain ridges

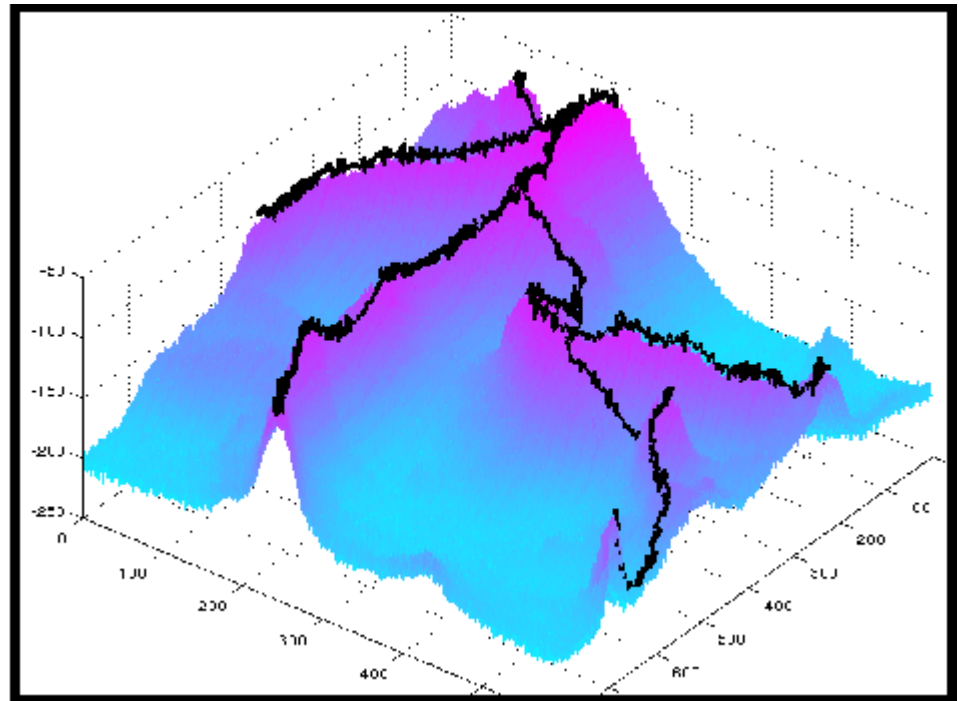

# 1-unstable Manifold

1-unstable manifold (of index  $d - 1$  saddle points)  $\Rightarrow$  mountain ridges

# 1-unstable Manifold

1-unstable manifold (of index  $d - 1$  saddle points)  $\Rightarrow$  mountain ridges

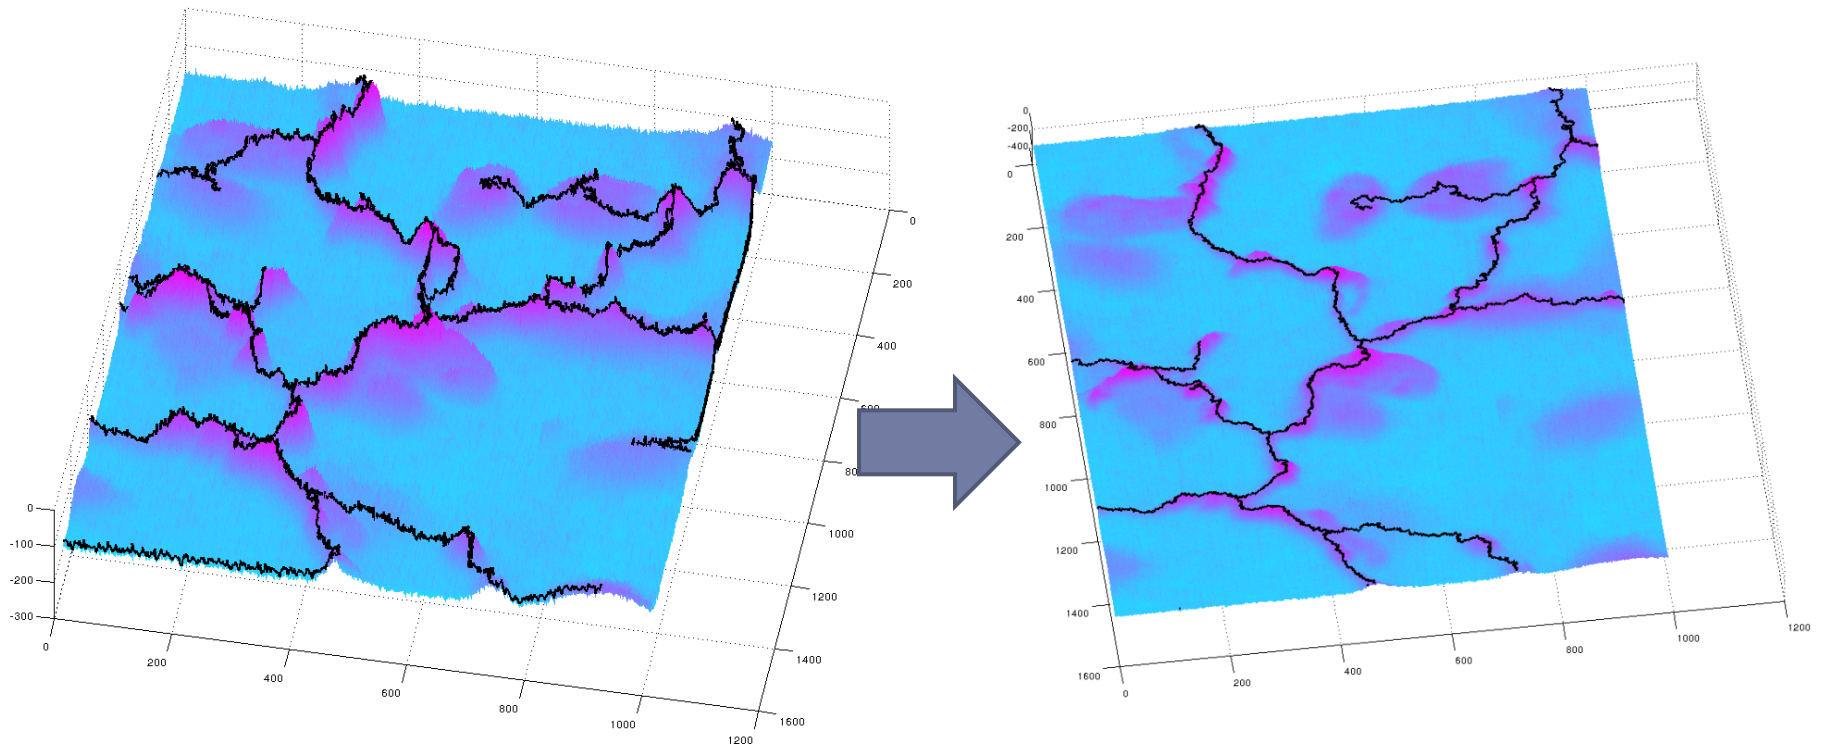

# Simplification

- ▶ How to decide which pair of critical points to simplify?
  - ▶ Use persistence homology  
*[Edelsbrunner, Letscher, Zomorodian 2002], [Zomorodian, Carlsson 2005], ...*

# Simplification

---

# Discrete Case

---

- ▶ Input: a piecewise-linear (PL) function defined on a simplicial complex domain
  - ▶ Given volumetric data (2D / 3D images), we can first triangulate it and convert it to a simplicial complex domain
- ▶ Leverage discrete Morse theory
  - ▶ *[Forman 1998, 2002]*
  - ▶ *[Gyulassy, 2008], [Sousbie 2011] (DisPerSE)*

# Neuron Reconstruction Overview

---

- ▶ **Input:** 2D/3D image  $f: I \rightarrow R$  with  $f$  given at grid points in  $I$ 
  - ▶ (1) Triangulate  $I$  to  $K$ , and potentially remove background cells to obtain PL function  $f: K \rightarrow R$
  - ▶ (2) Negate  $f$  to  $\hat{f} = -f$
  - ▶ (3) Compute 1-stable manifold for index-1 saddles
  - ▶ (4) Simplify to remove noise
  - ▶ (5) Output *Neuron-graph*  $G$
  - ▶ (6) Obtain a tree structure  $T$  from  $G$ 
    - ▶ Assign weights to arcs in  $G$  as integral of density  $f$  along the arc
    - ▶ Compute maximum spanning tree  $T$
